TOOL 01

Telegram Lead Finder

Find people asking for your service while you sleep

What it does

- Reads public Telegram groups where people ask for help, like "I need a cleaner for tomorrow" or "Who knows a good painter?"
- Checks every message against a long list of keywords for your niche. Most messages have none of them and get thrown out for free.
- Sends the few that match (about 1 in 10) to a cheap AI model. The AI decides: is this a real person asking for help, or just talk?
- Sends each real request to your phone as a Telegram message. You see the message, the group and the person's @handle.

Why it's built this way

Keywords first. Busy groups post 1,000 messages a day. If AI reads them all, you pay for them all. A keyword check is free, so it runs first. The AI reads only about 100. That cuts the AI bill by about 90%.

Many keywords. People ask in many ways ("need a painter", "who can paint my flat") and in many languages. Plan on 400 to 600 keywords for one niche.

A cheap AI model. Telling "I need a cleaner for tomorrow" from "I cleaned my house yesterday" is an easy job. A small model does it for a fraction of a cent.

Public groups only. It reads open groups anyone can join. It never posts or messages anyone by itself.

Handle only. You get the @handle and nothing else: no name, phone or email. That is enough for one polite private message, and you store very little personal data.

What you need

- A spare Telegram account to do the reading. Use a separate phone number, not your personal one.
- A Telegram bot to send the leads to you. You make one for free with Telegram's official @BotFather.
- A free "API ID" and "API hash" from my.telegram.org, so your program can log in.
- An AI API key (for example Anthropic or OpenAI). Use their cheapest model.

- An AI chat to build it with: Claude, ChatGPT or Claude Code.
- A small server (about $5 a month) or a laptop that stays on 24/7.
- 10 to 20 public groups in your city where people ask for services.

Rough monthly cost: under $10 for AI (about 100 messages a day) plus about $5 for a server. On your own laptop the server part is $0.

Build it step by step

Paste these into your AI chat one at a time. Test after each step before you go on.

1 Plan it first

COPY THIS PROMPT

```
I am not a coder. I want to build a small Python program that reads public
Telegram groups and finds people asking for a service in my niche: [YOUR NICHE].
It should: 1) filter messages by keywords, 2) send only matching messages to a
cheap AI model to decide if it is a real request, 3) send real requests to me
through a Telegram bot. Explain the plan in plain English and list the
accounts I need. No code yet.
```

2 Connect to Telegram and just print messages

COPY THIS PROMPT

```
Write a short Python script with the Telethon library. It logs in with my spare
Telegram account (API ID and hash read from a .env file) and prints each new
message from my groups with the group name and the sender's @username. Tell me
how to install Python and run it the first time.
```

3 Build the keyword list

COPY THIS PROMPT

```
My niche is [YOUR NICHE] in [YOUR CITY]. Write 500 keywords and short phrases
people use when they ask for this service in a group chat. Include trade names,
the jobs themselves, and ways of asking ("need a…", "who knows a good…",
"recommend a…"). Add common versions in [LANGUAGES YOUR COMMUNITY USES].
Then add 20 "blocker" phrases for job ads and spam. Save them as keywords.txt
and blockers.txt, one per line.
```

4 Add the free keyword filter

COPY THIS PROMPT

```
Load keywords.txt and blockers.txt. Skip a message if it has no keyword, has a blocker, or is the same text already seen in another group today. Print "KEYWORD HIT: <keyword>" for the rest. Count messages seen and keyword hits.
```

5 Let a cheap AI judge each hit

COPY THIS PROMPT

```
For each keyword hit, call the cheapest model of [AI PROVIDER] with this job: "Is this a real person asking to hire a [YOUR NICHE] service? Answer only JSON: {"is_lead": true/false, "reason": "one short sentence"}." Adverts, job posts, stories about past work, and requests for other services are NOT leads. Read the API key from .env. Wait 3 seconds between calls and retry if the API is busy. Log the cost of each call.
```

6 Send leads to your phone

COPY THIS PROMPT

```
Create the alert step. I made a bot with @BotFather and have its token and my chat ID. When the AI says is_lead is true, send me a bot message with: the group name, the original message, the sender's @handle, and the AI's reason. Add a last line: "Tip: reply with a 30-second video circle." Do not include names, phone numbers or anything else about the person.
```

7 Keep it running 24/7

COPY THIS PROMPT

```
Help me run this nonstop. Option A: a $5 a month Linux server with a service that restarts it if it crashes. Option B: my laptop, kept awake. Give exact steps for both, plus how to check the logs and the daily AI cost.
```

Make it yours

- **Change the niche.** Swap the keyword list and the AI question. The same tool works for lawyers, tutors, movers, cleaners or mortgage brokers.
- **Score the leads.** Ask the AI for urgency from 1 to 5 ("today" or "this week" scores high). Only send you the 4s and 5s.
- **Get a daily summary.** One bot message each evening: messages seen, leads found, AI cost.

Watch out for

- **Public groups only.** Read only open groups you joined as a normal member. Never read private chats. Respect each group's rules.
- **Telegram's rules and anti-spam.** Read Telegram's Terms of Service and API Terms. Joining many groups fast or messaging many strangers can get the account banned. Go slowly.
- **No mass messaging.** Reply by hand, one person at a time, only when you can really help.
- **Many people want freebies.** Lots of askers hunt for the cheapest deal. Expect a client or two a month. It adds to your ads and outreach. It doesn't replace them.
- **Privacy.** Keep only the message, the group and the @handle. Delete old leads. Privacy rules differ by country, so check yours.
