TOOL 02

Simple CRM

Every client and every talk in one place

What it does

- Keeps one card for each client. Phone, WhatsApp, budget, what they want, birthday, files and ID dates all sit on one screen.
- Shows a timeline for each client. Every call, message, email and note is in one line, newest first.
- Gives each person a call list every morning. It shows who to call today and who you forgot.
- Sends new leads to your team in a chat app. The first person to tap "Claim" gets the lead. If nobody does, it goes to the next person.
- Reminds you of birthdays and writes a short, warm message for you to check and send.
- Works on a phone like an app. Each person only sees the buttons they need.

Why it's built this way

Most CRMs fail for one reason: people stop opening them. Too many tabs, fields and reports. The CRM turns into an expensive list.

This one is built to be "stupid simple." Here is what we left out on purpose:

- **No big setup.** Start with the fields that matter. Add more later.
- **No long forms.** Logging a call is two taps: pick what happened, then "Done." The next call gets planned for you.
- **No email blasts.** Other tools do that well.
- **No report builder.** One home screen with a few numbers is enough.
- **One rule for leads.** First to claim wins. Nobody can sit on a lead.

The goal is simple. A new team member should be able to use it on day one without training.

What you need

- **A database with logins.** Supabase is a good choice. The free plan is fine to start. The paid plan is about $25 a month.
- **A place to host the app.** Vercel has a free plan. The paid plan is about $20 a month.
- **A chat bot for alerts.** A Telegram bot is free. WhatsApp alerts are possible too, but they cost more and take longer to set up.

- **An AI account** for the birthday messages. Claude or ChatGPT through their API. For a small team this is usually under $10 a month.
- **An AI helper to build it.** Claude Code, Cursor or ChatGPT. About $20 a month.

Rough total: **$0 to $75 a month** for a team of 10. A big-name CRM can cost $1,000 a month or more for the same team.

Build it step by step

Paste these one at a time. Test each step on your phone before you go on.

1. Start the project.

```
I'm not a programmer. Help me build a simple CRM web app for a small sales
team with Next.js and Supabase. Explain each step in plain words. First, set
up the project and a login page with email and password.
```

1. Make the client card.

```
Add a client card. Each client has: name, phone, WhatsApp, email, budget,
what they want, favourite areas, birthday, ID expiry date and notes. Show it
all on one phone-friendly screen with big "Call" and "WhatsApp" buttons. Show
a red warning if the ID expires within 60 days.
```

1. Add the timeline.

```
Add a timeline to the client card: calls, WhatsApps, emails, notes and
meetings, each with who added it and when, newest first. Let me pin a note
to the top, type a quick note, and record a short voice note.
```

1. Add the daily call list.

```
Add tasks with a client, a due date and an owner. Make a "call mode" that
shows today's calls one client at a time, overdue first. I tap what happened
(talked, no answer, call back), it saves to the timeline, and it asks when to
call next: "Tomorrow", "3 days" or "1 week".
```

1. Send new leads to the team.

```
Create a Telegram bot. When a new lead comes in, message every agent with
the lead's needs and a "Claim" button. The first to tap gets the lead. If
nobody claims it in 60 seconds, send it to the next agent. Keep the bot
token secret.
```

1. Add check-ins so leads don't go cold.

```
After a claim, have the bot ask "Did you reach this client?" after 15
minutes, 3 hours, 1 day, 3 days and 7 days, with buttons "Yes", "No answer"
and "Not a real lead". Save answers to the timeline. Stop after "Yes".
```

1. Add birthday messages.

```
Every morning, find today's birthdays and message the agent on Telegram.
Use the Claude API to write a short, warm birthday text from the client's
notes, with no sales talk. The agent checks it and sends it themselves.
```

1. Add the small helpers.

```
Add: (1) a one-tap "$ / $$ / $$$" button for how serious a client is;
(2) make it installable on a phone, and save notes typed with no signal once
I'm back online; (3) roles: owners see everything, agents see only their
clients and buttons.
```

Make it yours

- **Change the fields.** A car dealer might track "car model." A gym might track "goal."
- **Change the lead rule.** Instead of "first to claim," you can rotate leads one by one, or give leads by language or area.
- **Add your own stages.** For example: New, Talking, Viewing, Offer, Won, Lost. Keep it to six or fewer.
- **Pick your alert app.** Use Slack, WhatsApp or email instead of Telegram if your team lives there.
- **Change the AI message.** Use it for holidays, deal anniversaries or a "thank you" after a sale.

Watch out for

- **Client data is private.** Turn on row security so agents only see what they should.

- **Keys and tokens.** Keep them out of your code and screenshots. If one leaks, make a new one.
- **Too many features.** Before you add a button, ask: "Will my team use this every week?"
- **Messy phone numbers.** Store every number the same way, with the country code. Otherwise you will get the same client twice.
- **AI makes mistakes.** Always let a person read the birthday message before it is sent. Never let it send by itself.
- **Back up your data.** Turn on daily backups in your database. It costs little and can save your business.
