TOOL 03

Google Maps Scraper

Turn one search into a call list in minutes

What it does

- Sits in your Chrome browser as a small button. No app to install, no server.
- You search Google Maps for a type of business in a city, like "plumbers in Austin".
- You click one button. It scrolls the whole results list for you and reads every business card.
- It saves the name, category, address, phone, rating, number of reviews, website and Maps link.
- You click Export and get a spreadsheet. Sort by "Website" and the businesses with no website float to the top.
- That list is your call list for the day.

Why it's built this way

It is a Chrome extension, not a website. It works on the page you already have open. You see what it sees.

One button. Search, click, wait, export. No settings to learn.

It reads only what is already on the screen. It does not log in anywhere or break into anything. It reads the same public cards you could copy by hand, just faster.

It saves a plain CSV file. Every tool opens a CSV: Google Sheets, Excel, Numbers, any CRM. No lock-in.

It was built in a normal AI chat. You paste a prompt, get files back and test. When it breaks, you paste the error back into the chat.

Extra details come from a second, ready-made extension. Google Maps does not show emails. A tool like Scrap.io adds them to the cards. Its free plan was enough to start. The scraper just reads what that tool shows.

What you need

- Google Chrome on a computer.
- An AI chat: Claude or ChatGPT. The free plan can work. A paid plan (about $20 a month) handles long code better.
- A Google account for Google Sheets (free).

- Optional: an email-finder extension such as Scrap.io. It has a free plan and paid plans.
- About one afternoon.

Rough monthly cost: $0 to $20. There is nothing to host, so there is no server bill.

Build it step by step

Paste these into your AI chat one at a time. Test after each step before you go on.

1 Plan it first

COPY THIS PROMPT

```
I am not a coder. I want a simple Chrome extension (Manifest V3) that works on
Google Maps search results. When I click a button in the popup, it should scroll
the results list on the left, read each business card, and let me download the
results as a CSV file. Before writing code, explain in plain English which files
we need and what each one does. Keep it as small as possible.
```

2 Make the skeleton

COPY THIS PROMPT

```
Write the full code for every file: manifest.json, popup.html, popup.js and
content.js. The popup should have a big "Start" button, a counter that says how
many businesses were found, and an "Export CSV" button. For now the Start button
can just show "Hello from Google Maps" in the counter. Then tell me how to load
it in Chrome with Developer mode and "Load unpacked".
```

3 Read the cards

COPY THIS PROMPT

```
Now make content.js read the business cards that are visible in the Google Maps
results list. For each card, get: name, category, rating, review count, address,
phone, website link and the Google Maps link. Skip duplicates. Send the list back
to the popup and show the count. If you are not sure which page elements to use,
tell me how to right-click and "Inspect" a card so I can paste you the HTML.
```

4 Auto-scroll

COPY THIS PROMPT

```
Add auto-scroll. After Start, scroll the results list down a bit every second,
read the new cards each time, and stop when the list stops growing for about
5 tries. Update the counter as it goes. Add a Stop button that halts it.
```

5 Export the spreadsheet

COPY THIS PROMPT

```
Make "Export CSV" download a file named leads-YYYY-MM-DD.csv with one row per business and these columns: Name, Category, Address, Phone, Rating, Review Count, Website, Google Maps URL. Wrap every cell in quotes so commas in addresses do not break the file.
```

6 Keep results safe

COPY THIS PROMPT

```
Save the results in chrome.storage.local, so they are still there if I close the popup. Add a "Clear" button to start fresh before a new search. Let the scrape keep running if I switch to another tab.
```

7 Add a simple log

COPY THIS PROMPT

```
Add a second tab in the popup called "Logs". Write short plain-English lines there: "Started", "Found 40 so far", "Reached the end", and any error. When something breaks, I will copy the log and paste it to you.
```

8 Fix it when it breaks

COPY THIS PROMPT

```
The extension stopped finding businesses. Here is the log and the HTML of one result card (from right-click, Inspect, Copy outerHTML). Find what changed and give me the full updated content.js. Use a few backup ways to find the cards so one small change on the page does not break it.
```

Make it yours

- **Flag the hot leads.** Add a column "No website" that says YES when the website is empty.
- **Fit your country.** Ask the AI to read phone numbers and addresses in your local format. Many first versions only handle US formats.
- **Score each lead.** Add a column that ranks businesses with many reviews but no website. Busy and no website is a great call.
- **Make a call script.** Ask the AI for a short opener that uses the business name and category from each row.

Watch out for

- **Respect the site's rules.** Read the terms of any site you collect from, and use the tool in a fair, gentle way. Do not run it all day or on huge searches. This guide is not legal advice.
- **Follow local data and privacy laws.** Rules about storing contact details and cold calling differ by country. Check the rules where you and your leads are.
- **Only public business info.** Collect what a business shows to the public, like its business phone and website. Leave out private people, home addresses and personal social profiles.
- **No spam.** Call or write to a few businesses with a real offer. Honor every "no" and every do-not-call list. Never blast a list with the same message.
- **The page will change.** Google updates its layout often. When the counter stays at 0, use Step 8.
