TOOL 04

Offer Builder

Write a signed client proposal in 2 minutes, not 40

What it does

- Keeps all your services in one list, like products in an online shop. Each one has its price, tax, steps, needed documents and what's included.
- Lets a team member search, tick the services a client needs and drop them in a cart. The total, tax and discount add up by themselves.
- Lets you give a discount on one service or on the whole cart.
- Turns the cart into a nice web page for the client, in their language.
- Can put two options (A and B) in one link. The client compares them and picks one.
- Lets the client sign on their phone. It saves the time, their IP address and your company stamp on the signed copy.

Why it's built this way

Most offers are slow because people copy old Word files and fix prices by hand. With 300 services, that takes 40 minutes per offer.

So the tool works like a shop, not a document. Here is what we left out on purpose:

- **No free-text pricing.** Prices live in the service list. If a price changes, you change it once and every new offer is right.
- **No PDF attachments.** The client gets a link. A link opens on any phone and is always up to date.
- **No separate e-sign tool.** The signature is drawn on the same page. You don't pay for extra signing seats, and the client doesn't have to make an account.
- **No long editor.** The steps, documents and "what's included" text come from the service. The team member only picks and adjusts.

What you need

- **A service list.** A spreadsheet with name, price, tax, steps, documents and what's included. Start with your top 30 services, not all of them.
- **A small database.** Supabase free plan, or about $25 a month.
- **A place to host the app.** Vercel, free or about $20 a month.

- **An email service** to send the link and the signed copy. Resend or similar, free for small volumes.
- **An AI helper to build it.** Claude Code, Cursor or ChatGPT. About $20 a month.

Rough total: **$0 to $65 a month**. It pays for itself the first week you send ten offers.

Build it step by step

Paste these one at a time. Test each step with fake data.

1. Start the project and the service list.

```
I'm not a programmer. Help me build a simple offer builder with Next.js and
Supabase, and explain each step in plain words. First create a "services"
table: name, category, price, tax percent, steps (a list), required documents
(a list), what's included (a list), and an "active" switch. Then help me
import my services from a CSV file.
```

1. Make the shop screen.

```
Make a page called "New offer". On the left: a search box and the list of
services grouped by category. Each service has a checkbox and a quantity. On
the right: a cart that shows each picked service, its price, the tax, and the
total. Update the total as soon as I tick or untick something.
```

1. Add discounts.

```
In the cart, let me add a discount to one line (in percent or in money). Also
add one box called "Discount on everything" that applies a percent to every
line. Show the old price crossed out and the new price next to it. Show the
total saved at the bottom.
```

1. Save the offer and make a client link.

```
Add a "Create offer" button. It saves the client name, email, language, the
picked services (copy the price and text at that moment, so later price
changes don't change old offers), and the totals. Give each offer a long
random link like /offer/abc123 that works without a login.
```

1. Build the client page.

```
Make the public offer page. Show my logo, the client's name, each service
with its price, steps, what's included and documents needed, then the tax
and total. It must look good on a phone. Add an English / Second-language
switch at the top that changes all the text.
```

1. Two options in one link.

```
Let me build two versions of the offer, "Option A" and "Option B", in the
same builder, using tabs. On the client page, show them side by side (stacked
on a phone) with a "Choose this option" button. The client can switch
between them before signing. Save which one they picked.
```

1. Let the client sign.

```
Under the chosen option, add a sign box: full name, email, a "I agree to the
terms" checkbox, and a signature pad that works with a finger. When they
press "Accept & Sign", save the signature image, the time, and the IP address
from the request. Lock the offer so nobody can change it after signing.
```

1. Make the signed copy.

```
Make a "signed" page for each signed offer that looks like a contract: both
parties, the services and totals, the terms, the client's signature, the date
and IP address, and our company stamp and signature image. Add a "Download
PDF" button and email a link to both sides.
```

Make it yours

- **Packages:** save popular bundles (for example "company + 2 visas + bank account") as one click.
- **Auto add-ons:** if someone picks service X, add service Y on its own, like a yearly support plan.
- **Expiry dates:** make offers expire after 7 days, with a polite reminder email 2 days before.
- **Payment link:** after signing, show a "Pay deposit" button from your payment provider.
- **Dashboard:** list every offer with its status and owner, and the total signed this month.

Watch out for

- **E-signature rules differ by country.** A drawn signature with time and IP is fine for many everyday deals, but some contracts need more. Check your local e-signature rules (or ask

a lawyer) before you rely on it. This is not legal advice.

- **Keep costs private.** Your profit and supplier costs must never reach the client page. Ask the AI to check this on purpose.
- **Snapshot the prices.** Copy prices into the offer when it is created. Otherwise a price change next month quietly changes old offers.
- **Translations need a human check.** AI translations are good, but legal and money words should be read by a native speaker once.
- **Start small.** Load 30 services, use it for a week, then add the rest.
